

You may be kept awake at night by the noise and this could make you tired and stressed	Fish, crabs, shellfish and wildlife are often killed or made ill by pollutants in the water	We can breathe in pollutants which can cause health problems such as asthma
People may not want to live near something that doesn't look attractive so people move out of the area	An unnatural glow above towns and cities scares wildlife and can make birds like owls lose their way	Toxic waste that pollutes the soil can be washed into rivers and reservoirs, it could then danger wildlife
Diseases such as cholera can be spread by polluted water	Sewage in water can be smelly for people living near the outlet pipe	Lots of rodents like rats, mice and insects are attracted to landfill sites
Pollutants in the air adds to the greenhouse effect which encourages global warming	Unnatural noises may scare wildlife so there may be a loss of diversity	If fruit and vegetables are grown on contaminated land they will be no good to eat
Landfill sites can be very smelly	If it is loud enough you may experience hearing loss	Animals could get caught up in waste and become injured
